

Firefly Services is an API suite, not an app

Here's the map before you write a line of code.

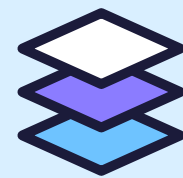

Ten API families, not one product

As listed in Adobe's Firefly Services docs.

Firefly API

Photoshop API

InDesign API

Lightroom API

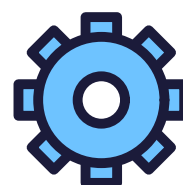

Audio/Video API

Substance 3D API

Illustrator API

Creative Production

Express API

Content Tagging

1 Firefly makes pixels

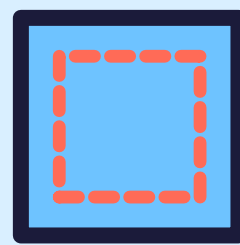

Four jobs, all on images.

Generate

text to image

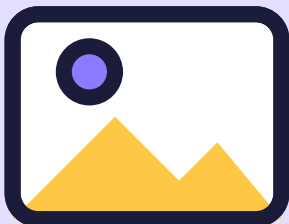

async job

Expand

outpaint to new sizes

async job

Fill

redo a masked region

async job

Similar

variants of an approved shot

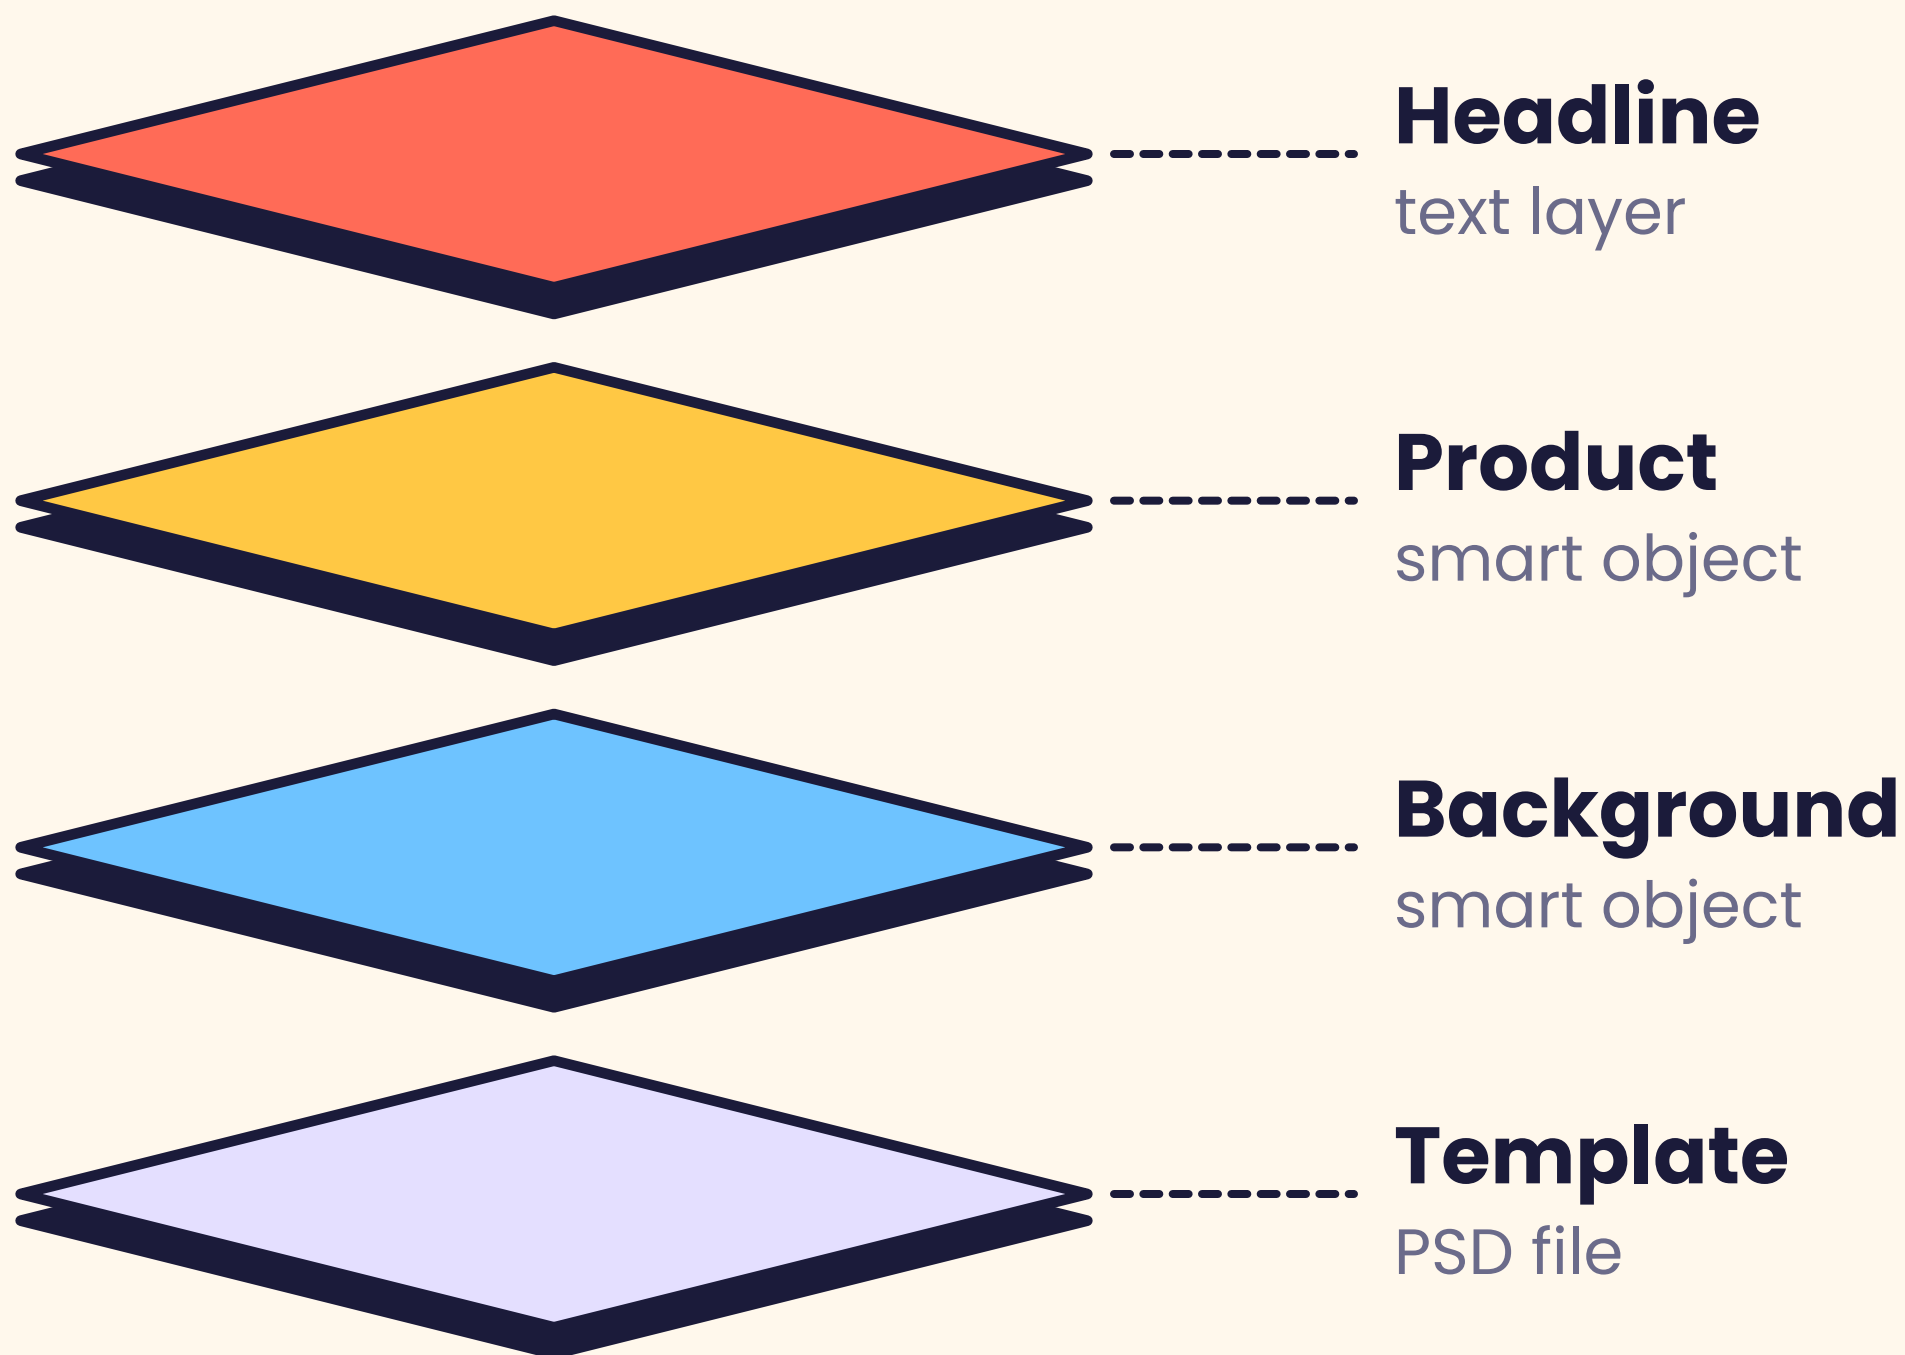

async job

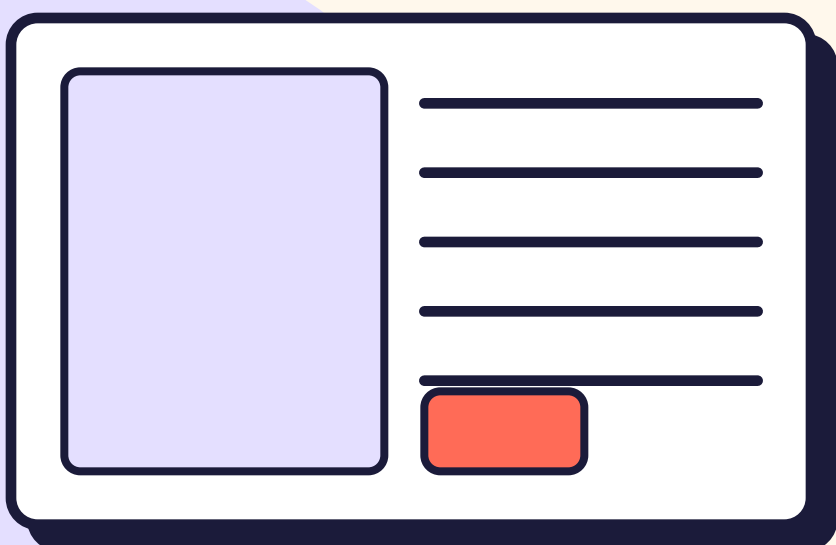

Not its job

Layers, live text, page layout. That's Photoshop and InDesign territory.

2 Photoshop and InDesign handle structure

A PSD is a stack you can edit by name.

InDesign API:

composes documents and layouts from your data.

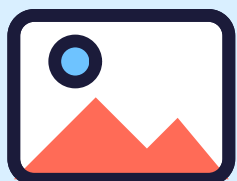

3 Think pipeline, not prompt

One way the pieces can chain together.

Trigger

event from your PIM or CRM

Firefly: expand

POST /v3/images/expand-async

Photoshop: composite

POST /v2/create-composite

Your DAM

finished files land in storage

4 Pick the right tool

Match the job to the API that owns it.

Make a new background

Firefly

Swap a product into a template

Photoshop

Change headline text

Photoshop

Build a multi-page layout

InDesign

Text edits in Photoshop API v2 run through execute-actions.

Which API would you wire in first?

Answer in the comments. I read every one.

Firefly

Photoshop

InDesign

Something else

Next: the auth and storage details that break calls before anything renders.
