

FOR BRAND TEAMS

Your custom model trained. Your API can't see it yet.

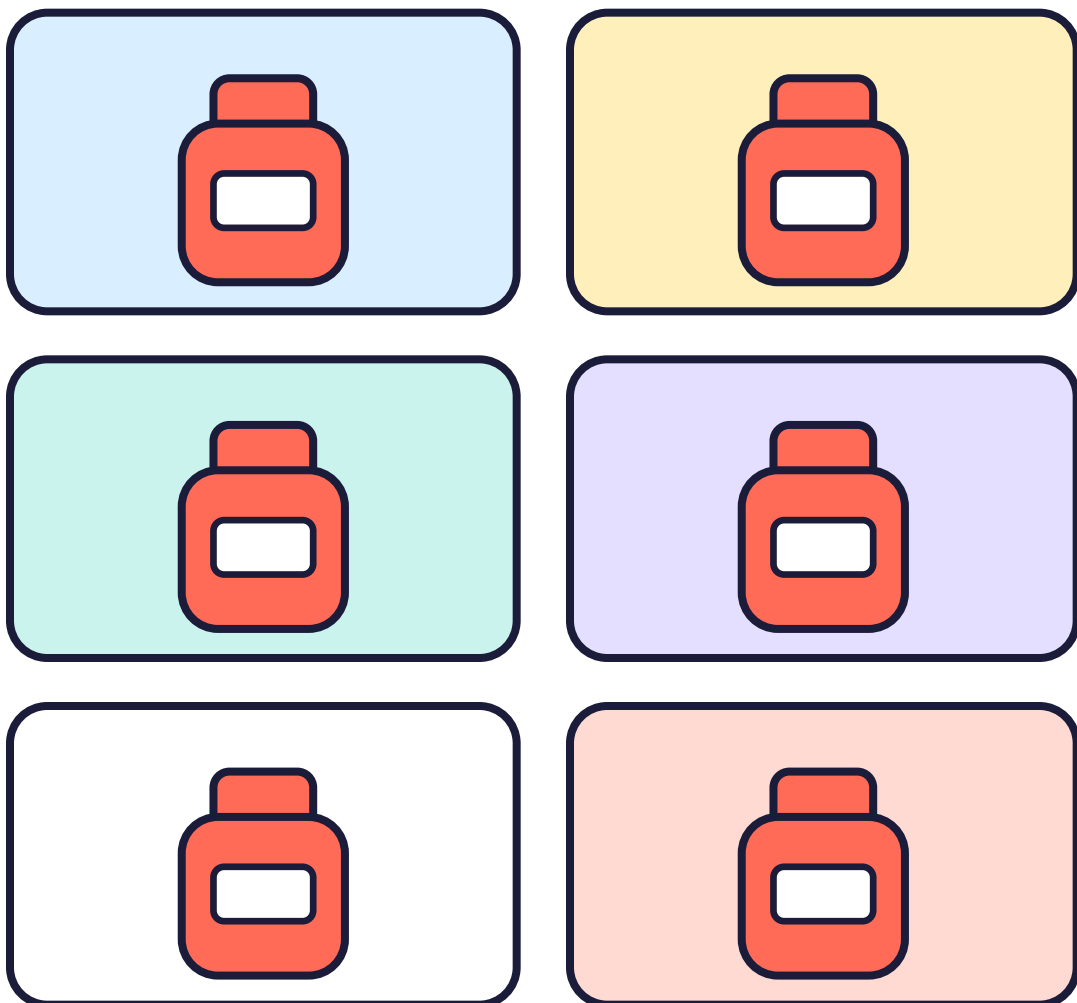

the missing step: sharing

1 Subject or style?

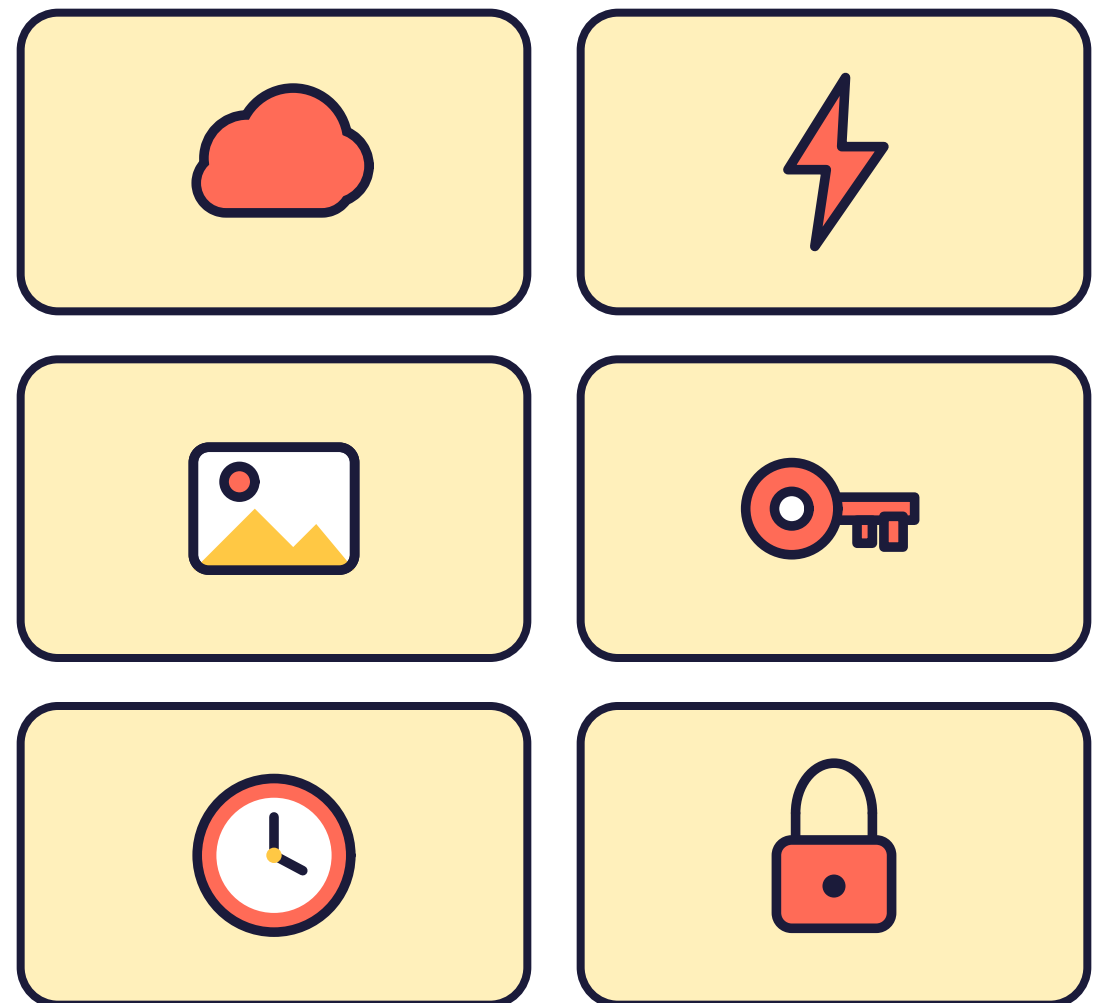

Train them as separate models.

Subject

one product or character

Style

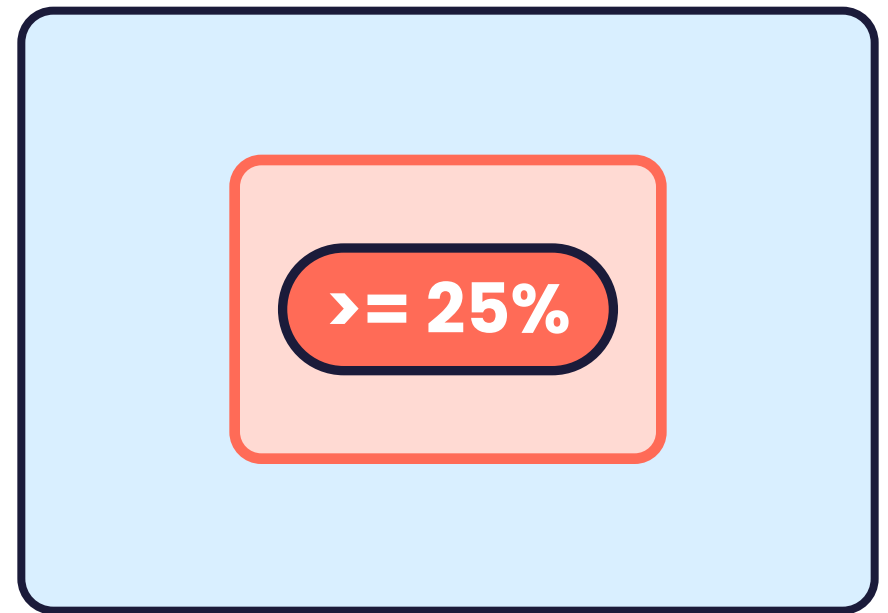

a shared look and feel

Both types take 10 to 30 images in Firefly's training flow.

2 What a subject set looks like

10–30

images to upload

of the frame

Same product, same color

In clear focus, near the center

Vary angle and lighting

Mix plain and busy backgrounds

Per Adobe's custom models guidance.

3 Share it with the technical account

1 Developer Console

Open your project, then the API credential.
Copy the Technical Account Email.

2 Firefly

Open the custom model, click the ... menu,
choose Share, add that email.

3 Done

The model is available to List Custom Models
and image generation.

4 Then call it

Header for the model version, body for the model ID.

request

```
POST /v3/images/generate-async
x-model-version: image3_custom

{ "prompt": "...",
  "customModelId": "<your id>" }
```

Your custom model
generates the image

Adobe's tutorial uses image3_custom. The v3 spec also lists image4_custom.

5 Can't see it? Check the list

```
GET https://firefly-api.adobe.io/v3/custom-models
```

Brand sneaker v2

shared

Watercolor style

shared

Mascot v1

not shared: missing

Models shared with your credential appear here. If yours is missing, go back to the share step.

Model names above are examples.

Subject model or style model first?

Answer in the comments. I read every one.

Subject

Style

Both

Not sure yet

Next: Photoshop API v1 is past end of life.
Here's the v2 map.
