

Anti-patterns that look like governance

Careful on a diagram, fragile in production.

looks like governance

and what to do instead

1 Looks like governance vs what works

Same goal, different design.

Looks like governance

An org per brand

An instance per agency

Point-to-point APIs

Free-text fields

A spreadsheet handoff

Do instead

One org, groups

One instance, permissions

Fusion + native connectors

Controlled vocabularies

Record conversion

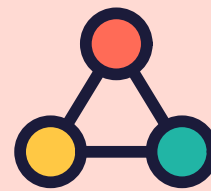

2 The math against point-to-point

Pairs of systems grow faster than systems.

3 systems

up to 3 integrations

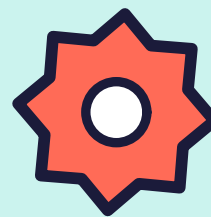

6 systems

up to 15 integrations

10 systems

up to 45 integrations

A hub

one connection per new system

native connectors

3 The agent-era twins

Same mistakes, faster.

Broad account

one identity across every brand

isolation lost

Pairwise wiring

agents wired to each system

brittle

Output as truth

agent output treated as the record

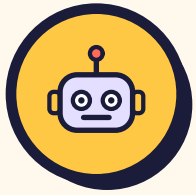

unreviewed

No approval

the human step removed to save time

no gate

Agentic angle

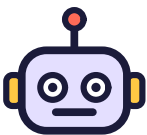

Anti-patterns have agent versions: one broad account, point-to-point wiring, output as truth, no human approval.

Status as of Sept 2026. Confirm in your own tenant.

Sources on slide 7

Best practices

Narrow, named, auditable agent identities.

Use a gateway or hub, not pairwise wiring.

Agents propose; humans or rules commit.

Check the IMS org on every MCP connection.

ADOBE DOCS

Untagged items are design advice.
